

DIALS: MATERIAL IDENTIFICATION OF BOURDON TUBE AND SOCKET

Our policy is to print on each pressure gauge dial information relative to the materials of the Bourdon tube and socket. The reason for this requirement is to enable a user to safely apply a gauge in accordance with our own recommendations as well as those of ASME B40.100. The materials of both the tube and socket must be identified, as there is no easy way for a user to identify the materials of the tube and socket visually.
